

Smart Solutions and smart integrations - EPBD based

(EPBD – direktiva o energetskej efikasnosti zgrada)

Sarajevo, 09/10.07.2019.

Hrvoje Krpanić, dipl. ing. strojarstva

Daikin Airconditioning Central Europe GmbH

Baseline:

1. High level goals EPBD (Montreal, Kyoto, Paris, Kigali)
2. EU framework : all related regulation - clean energy package)
(= HOW)
3. EPBD
→ Creates also business opportunities - how to exploit
→ More drivers for change
4. Local transposition of EU regulation,
→ no need to wait - advantage to enter early (local awareness).

WHY to do it ?

HOW this will
be done?

WHERE are business
impacts?

WHEN will it be?
WHO should do ?

Climate strategies and targets in the EU

In 2015, the EU was responsible for 10% of world greenhouse gas emissions.
The EU is one of the major economies with the lowest per capita emissions.

Climate strategies and targets in the EU

In 2015, the EU was responsible for 10% of world greenhouse gas emissions. The EU is one of the major economies with the lowest per capita emissions.

| Strategy | Greenhouse gas emissions reduction target (compared to 1990) | Current Status |
|---|--|---|
| 2020 Climate & Energy package | -20% by 2020 | Policies & measures in place. Already reached the target |
| 2030 Climate & Energy framework | -40% by 2030 | Committed and submitted as INDC to the Paris Agreement. Policies & measures under preparation. |
| Roadmap to a 2050 low-carbon economy | -80% by 2050 | Long term vision, not yet committed. In line with IPCC assessment of reductions required from developed countries as a group to reduce by 80-95%. |

INDC : Intended Nationally Determined Contributions to the Paris Agreement

https://ec.europa.eu/clima/policies/strategies/2050_en

To make the transition, the EU need to invest an additional €270 billion (or on average 1.5% of its GDP annually) over the next 4 decades.

8 LEGISLATIVE PROPOSALS

- ✓ **Energy Union Governance Regulation**
- ✓ **Recast Electricity Market Regulation**
- ✓ **Recast Electricity Market Directive**
- ✓ **Regulation on Risk-preparedness in the electricity sector**
- ✓ **Recast Renewable Energy Source Directive**
- ✓ **Recast Energy Efficiency Directive**
- ➔ ✓ **Recast Energy Performance of Buildings Directive**
- ✓ **Recast Regulation establishing **ACER** (Agency for the Cooperation of Energy Regulators)**

EPBD 2018 revision introduced on 9th July 2018.

EU countries will have 20 months to implement → 9th March 2020 !
Still 8 months to go...

Introduces amendments to the current Directive aimed at accelerating the cost-effective renovation of existing buildings, with the vision of a decarbonised building stock by 2050 and the investments increase.

The revision also supports: electromobility infrastructure, deployment in buildings' car parks and introduces new provisions to enhance smart technologies and technical building systems, including automation.

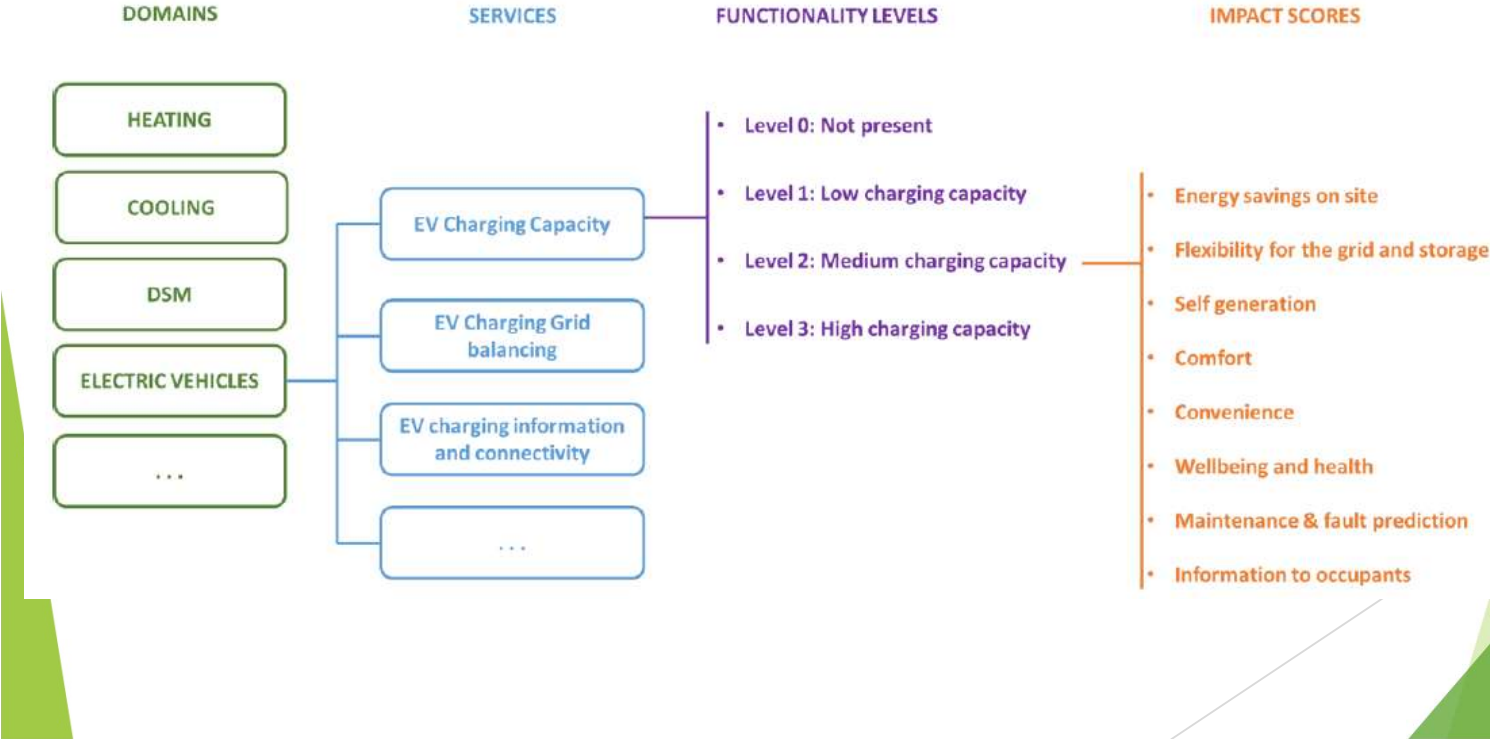

SMART READINESS OF BUILDINGS

- Optional scheme to be established by end 2019
- Rating of
 - Buildings' capability to adapt its operation to the needs of the occupant and the grid,
 - To improve its energy efficiency and overall performance
- Level of smartness to be integrated in Energy Performance Certificates

SMART READINESS OF BUILDINGS

Example : Technology neutral methodology

INSPECTION TECHNICAL BUILDING SYSTEMS (TBS) - example

technical equipment for space heating, space cooling, ventilation, domestic hot water, built-in lighting, building automation and control, on-site electricity generation or a combination thereof, including those systems using energy from renewable sources, of a building or building unit.

Inspections should evaluate performance of the system, but also should identify issues or problems, propose solutions or improvement measures and log the results of the inspection in a report for future reference.

Equipment remote monitoring

Connected air conditioning works smarter. We offer several ways to manage your products and installations remotely. From performance monitoring to predictive logic and analyses and more, our Intelligent Network is a cost-efficient way to increase the security, uptime and reliability of your installation.

Indoor Air Quality in European Schools

INDOOR AIR QUALITY (IEQ)

- More awareness related to IAQ
- To be reflected in buildings undergoing major renovations
- Energy performance calculation
- decision on Technical Buildings Systems

There are currently **95,000,000 pupils** in Europe¹. As children spend around **70%** of their time indoors, a good learning environment is crucial.

Recommended levels of CO₂

As classrooms are densely occupied spaces with a metabolic production of CO₂ by the occupants, the CO₂ concentration is directly dependent on the ventilation rate.

Recommended values lie between **1,000-2,000 ppm**. While levels below 1,000 ppm are considered as hygienically unproblematic, levels above 2,000 ppm are hygienically unacceptable².

CO₂ concentration in classrooms

Although there have been improvements to school buildings in recent years, many classrooms still don't provide an optimum indoor environment for learning.

Studies have reported that many schools have CO₂ levels above the recommended range of 1,000 to 2,000 ppm³.

Improved indoor air quality = Improved performance

- An average increase in performance by 2.8%, and even 15% in specific cases⁴
- Increased speed
- Higher levels of attention and concentration
- Lower rates of absenteeism

Increase in performance = economic growth

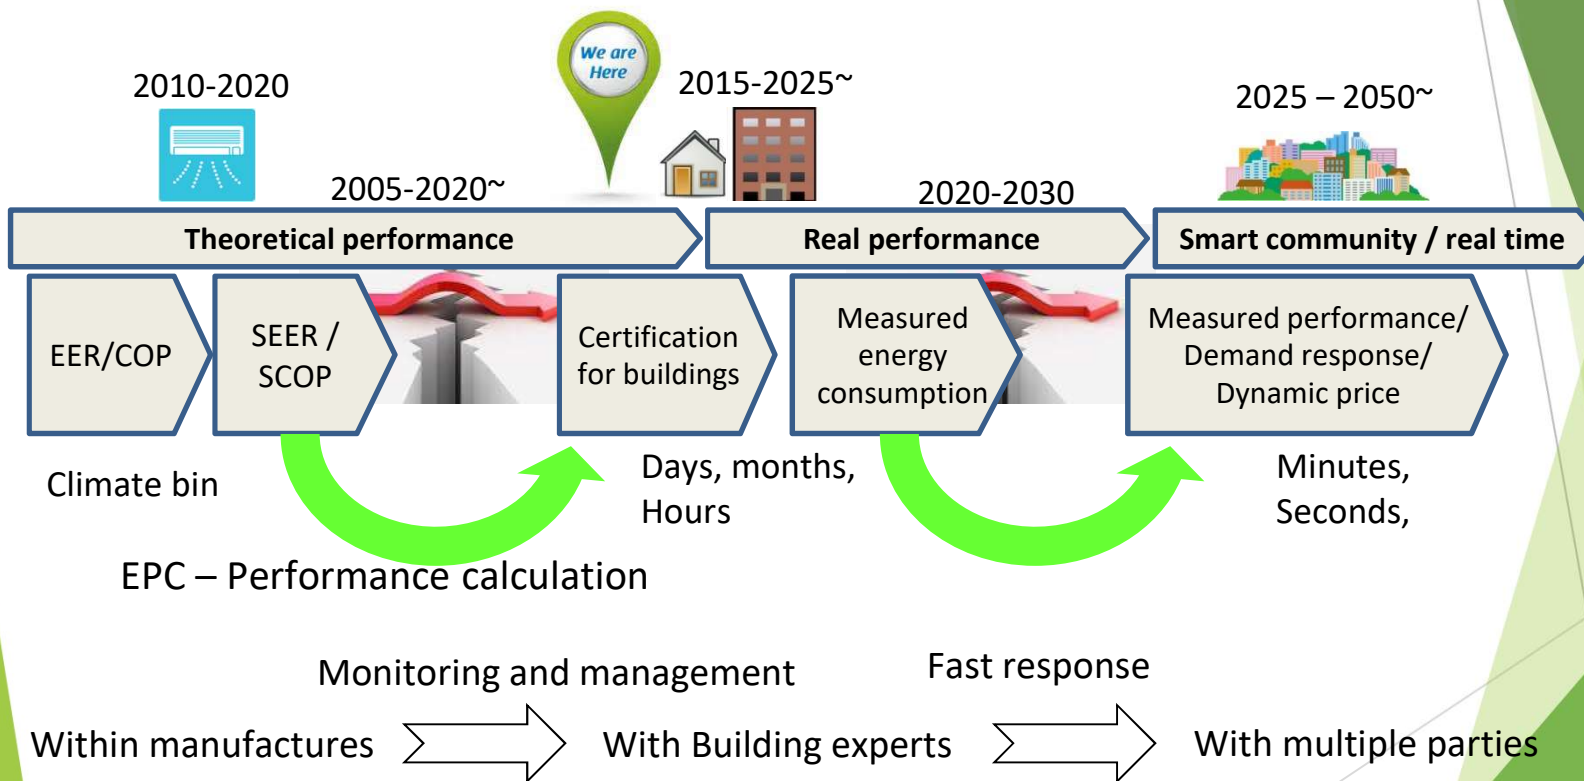

An increase of school childrens' performance by 2.8% would lead to a 6.7% - 9.5% increase in the conditional economic growth of the country (based on GDP per capita)^{4,5}.

How to improve the indoor air quality in classrooms

- As most schools in Europe have been designed for natural ventilation, more time should be set aside for airing during lessons.
- Innovative natural ventilation solutions, e.g. demand-controlled natural ventilation, can maintain the CO₂ level within the recommended range.
- Mechanical ventilation systems can ensure an optimum level of air quality without compromising thermal comfort in colder months.
- Hybrid solutions can combine the advantages of both natural and mechanical ventilation.

National Energy and Climate Plans (NECPs)

According to the governance of the energy union and climate action rules, which entered into force on 24 December 2018, EU countries are required to:

- develop integrated National Energy and Climate Plans (NECPs) that cover [the five dimensions of the energy union](#) for the period 2021 to 2030 (and every subsequent ten year period) based on a common template
- submit a draft NECP by 31 December 2018 and be ready to submit the final plans by 31 December 2019 to the European Commission
- report on the progress they make in implementing their NECPs, mostly on a biennial basis

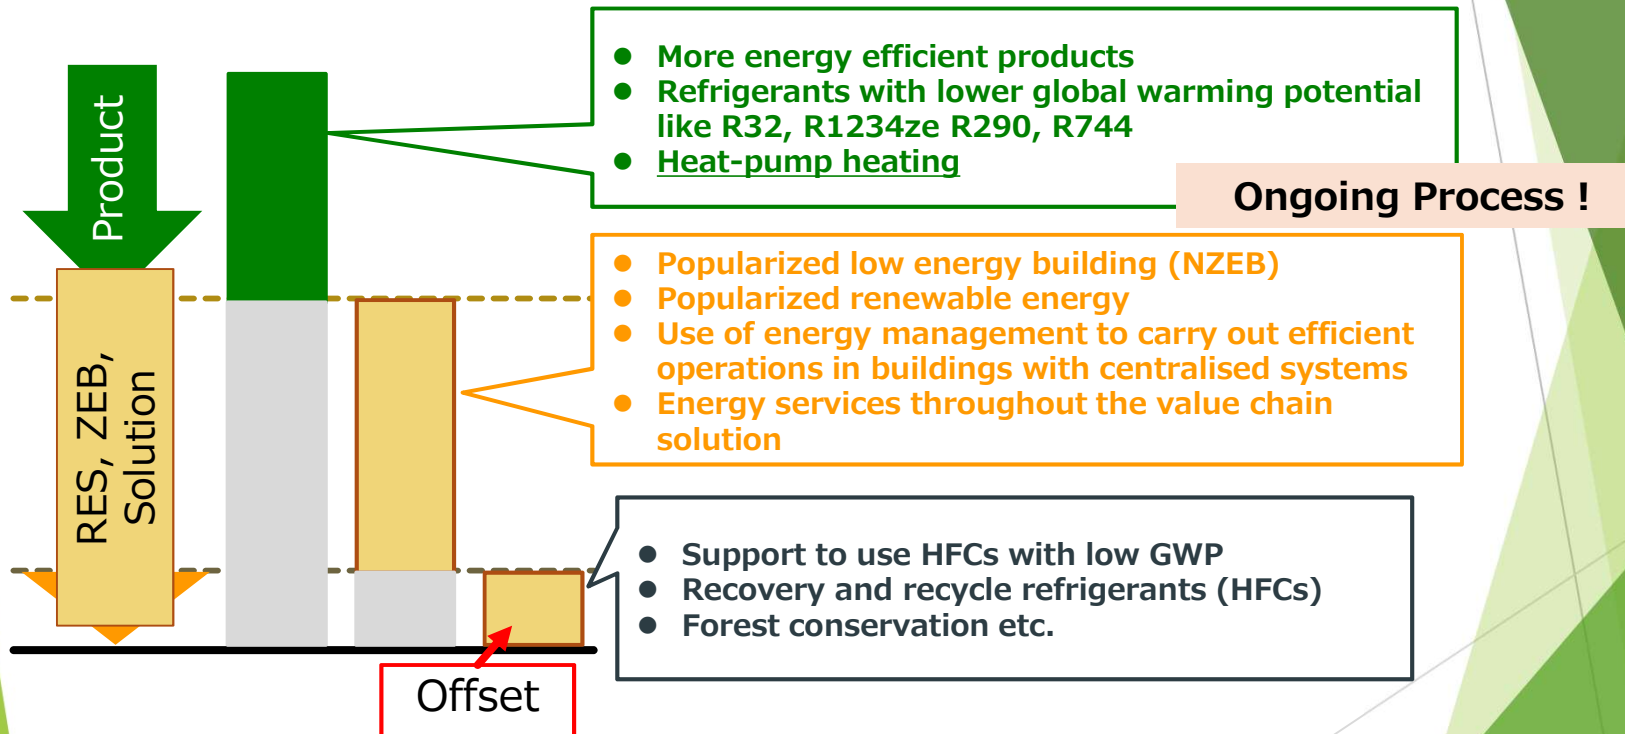

We will reduce the CO2 emission generated throughout the entire life cycle of our products.

Furthermore, we will create solutions that link society and customers as we work with stakeholders to reduce CO2 emission to zero.

Using IoT and AI, and open solutions, we will meet the world's needs for air solutions by providing safe and healthy air environments while at the same time contributing to solving global environmental problem.

This is how corporation aims to carbon neutral technology

TODAY'S ELECTRICITY
central power, decentral demand.

GRID MODERNIZATION

TOMORROW'S CHOICES
The future supply AND demand will be decentralised.

EU - 20/20/20 Targets until 2050 targets of -80% of carbon emissions ...

- New policy goals are impacting energy transformations globally
- With increasing renewable technologies, EVs : Loads are increasing on electrical distribution grids
- Need of optimisation of energy

TODAY: ONE-WAY POWER SYSTEM

- Large, centrally located generation facilities
- Designed for one-way energy flow
- Utility controlled
- Technologically inflexible
- Simple market structures and transactions
- Highly regulated (rate base) and pass through

EMERGING: THE ENERGY CLOUD

- Distributed energy resources
- Multiple inputs and users, supporting two-way energy flows
- Digitalisation of the electric-mechanical infrastructure: smart grid and behind the meter energy management systems
- Flexible, dynamic, and resilient
- Complex market structures and transactions
- Regulation changing rapidly around renewables, distributed generation (solar, microgrid, storage), net metering etc.

Heat pumps are being an environmental solution for

- Heating and hot water in residential buildings, both in single and multi-family homes. Depending on the local building tradition, heat is distributed via water-based systems (radiators, floor-heating) or via air-conditioning devices (ducted or ductless systems).
- High efficient low temperature regimes, enable meeting requirements in all new buildings including 'near-zero' energy, 'passive' houses and energy 'plus' building designs.
- Replacing oil and gas boilers in existing buildings is the biggest challenge. In some cases, heat pump solutions are available, but most likely, 'hybrid' heat pumps should be used. Hybrid systems combine heat pumps with other technologies (solar thermal, biomass, gas, oil) and provide these services during very cold winter periods.
- If at a later stage the building envelope is refurbished, then a heat-pump only solution is feasible and preferable.
- Connectable with smart solutions and fulfilling future needs, remote controlling available now already, easy integration in any system.
